Title: System and Method for Unified Registration Information Collection

TRANSMITTAL LETTER AND CERTIFICATE OF MAILING

To: Commissioner of Patents and Trademarks
Washington, D.C. 20231
From: Steven R. Sponseller (509) 324-9256
Lee & Hayes, PLLC
421 W. Riverside Avenue, Suite 500
Spokane, WA 99201

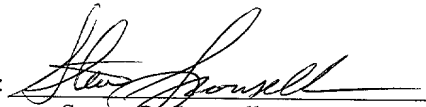

The following enumerated items accompany this transmittal letter and are being submitted for the matter identified in the above caption.

1. Transmittal Letter with Certificate of Mailing included.
2. PTO Return Postcard Receipt
3. New patent application (title page plus 29 pages, including claims 1-30 & Abstract)
4. Executed Declaration
5. 4 sheets of formal drawings (Figs. 1-4)
6. Assignment w/Recordation Cover Sheet

Large Entity Status ☒ Small Entity Status ☐

The Commissioner is hereby authorized to charge payment of fees or credit overpayments to Deposit Account No. 50-0463 in connection with any patent application filing fees under 37 CFR 1.16, and any processing fees under 37 CFR 1.17.

Date: 10-25-99

ATTORNEY'S DOCKET NO. MS1-311US

1 **TECHNICAL FIELD**

2 This invention relates to computer systems and collection of information
3 regarding computer system users. More particularly, the invention relates to
4 unified collection and uploading of user registration information.
5

6 **BACKGROUND OF THE INVENTION**

7 Uses for computers in our daily lives are continually expanding. As these
8 uses expand, it is beneficial for the manufacturers of both the computers and the
9 software the computers run to have information on the manner in which the
10 computers and software are used, as well as information on the users of the
11 computers and software. Having such information assists the manufacturers in
12 designing and creating computers and software that are more useful and better
13 aligned with users' needs and desires. Providing such information to the
14 manufacturers is also beneficial to users on a daily basis because the manufacturer
15 can personalize the user's computer/software experience by establishing an on-
16 going electronic relationship with the consumer.

17 One approach to obtaining such information is to collect "registration
18 information" or "registration data" from the user and transmit it to the
19 manufacturer. Registration information refers to demographic and other
20 information regarding the user and the user's computer. This might include
21 information such as the user's intended use of the computer or software, the user's
22 preferred activities, hobbies, other computer hardware or software components or
23 peripherals that are being used in conjunction with the computer or software, the
24 user's electronic mail or street address, locale information (e.g., zip code), etc.
25 The registration information may also include information regarding the computer

1 itself (e.g., identification numbers, processor type, amount of memory, installed
2 components, etc.).

3 Registration information is typically collected via multiple "registration
4 wizards", each of which is a program that is executed when the computer is
5 initially set up by the user or the software is installed. Each registration wizard
6 asks the user various questions to elicit the registration information, and may also
7 interrogate the computer itself to obtain information (e.g., processor type)
8 regarding the computer. Once the registration information is collected, the
9 registration wizard transmits or "uploads" the collected information to a
10 registration database, from which a manufacturer is able to subsequently retrieve
11 the collected information. The registration database is typically accessed via a
12 direct-connection (e.g., a direct phone call to a computer system maintaining the
13 registration database) or via a network (e.g., the Internet, which may also require a
14 modem call to access the network).

15 There are typically different registration wizards for the computer, one or
16 more of the software programs being run on the computer, and sometimes for
17 additional peripheral devices coupled to the computer (e.g., printers or scanners).
18 However, much of the information that the different manufacturers want to obtain
19 is often the same (e.g., name, address, phone number, etc.). Requiring users to
20 repeatedly answer the same questions over and over results in a time-consuming,
21 "unfriendly" user experience. Thus, it would be beneficial to provide a more user-
22 friendly way to collect registration information.

23 Additionally, once the registration information is collected the user's
24 computer typically makes multiple modem calls to upload the registration
25 information. One modem call (whether the connection be direct or via a network)

is typically made to each of the registration databases. Making such multiple modem calls is a further time-consuming process and, due to the time involved, can result in a further “unfriendly” user experience. One solution to this problem is for the computer to make a single modem call to the computer manufacturer or a designated third party, which receives all of the registration information, and then transfers the appropriate parts of the registration information to all parties interested in the data. However, this can be problematic because the manufacturer or third party may not want to receive all of the information, or there may be disagreements between the manufacturers regarding which of them pays for the modem call from the computer to the specified manufacturer.

The invention described below addresses these disadvantages of the prior art, providing an improved way to collect and upload user registration information.

SUMMARY OF THE INVENTION

A client computer collects registration information and uploads the collected information to one or more remote registration databases. The collection and/or uploading of registration information for multiple manufacturers is performed in a unified manner, improving the user-friendliness of the computer.

According to one aspect of the invention, a single user interface is used to collect the registration information for all of the manufacturers. By using a single user interface, a user is not presented with the same question by each of the multiple manufacturers. Rather, asking of common questions (e.g., the user’s name) is performed once and the collected response information is then provided to each of the multiple manufacturers.

1 According to another aspect of the invention, a multiple posting method is
2 used to upload the registration information to more than one registration database.
3 In the multiple posting method, a single network communication link (e.g., via a
4 single modem call) is established between the client computer and a network that
5 the registration databases are coupled to. Once the communication link is
6 established, additional client computer to registration database connections are
7 established via the communication link, allowing the registration information to be
8 uploaded to multiple registration databases via the single communication link.

9 10 **BRIEF DESCRIPTION OF THE DRAWINGS**

11 The present invention is illustrated by way of example and not limitation in
12 the figures of the accompanying drawings. The same numbers are used
13 throughout the figures to reference like components and/or features.

14 Fig. 1 illustrates an exemplary client computer and multiple remote
15 registration servers in accordance with the invention.

16 Fig. 2 shows a general example of a computer that can be used as a server
17 or client in accordance with the invention.

18 Fig. 3 is a flowchart illustrating an exemplary process for the unified
19 collection of registration information in accordance with one implementation of
20 the invention.

21 Fig. 4 is a flowchart illustrating an exemplary process for posting of
22 collected registration information in accordance with one implementation of the
23 invention.

DETAILED DESCRIPTION

Architecture

Fig. 1 illustrates an exemplary client computer 102 and multiple remote registration servers 104 and 106 in accordance with the invention. Registration data or information is collected at client computer 102 and subsequently transferred (also referred to as “uploaded” or “posted”) to registration server 104 and/or 106, where the registration information is stored in one of registration databases 108, 110, or 112.

Client computer 102 communicates with servers 104 and 106 via a data communications network 114. In the illustrated example, data communications network 114 can include one or more of: the Internet, a public switched telephone network (PSTN), local area networks (LANs), and private wide area networks (WANs). Communication between client 102 and registration servers 104 and 106 can be via any of a variety of conventional communication protocols, such as the Hypertext Transfer Protocol (HTTP).

Registration server 104 is coupled to registration databases 108 and 110, while registration server 106 is coupled to registration database 112. Although illustrated separately, it is to be appreciated that registration databases 108 and/or 110 may alternatively be part of server computer 104, and registration database 112 may alternatively be part of server computer 106. Servers 104 and 106 may have additional conventional “web server” functionality, or alternatively may be dedicated servers used only for receiving registration information only.

Client computer 102 includes an operating system 116, registration wizard 120, posting modules 122, and multiple (*n*) additional applications 124. Operating system 114 represents any of a wide variety of conventional operating systems,

such as the “Windows” brand of operating systems, available from Microsoft Corporation of Redmond, Washington. Registration wizard 120 and posting modules 122 are illustrated as separate from operating system 116. Alternatively, one or more of wizard 120 and modules 122 may be incorporated into operating system 114. Additional software applications 124 may also be running on client 102. Examples of such applications include games, word processors, spreadsheets, etc.

Operating system 116 includes a network module 126 that controls the access of client computer 102 to network 114. Network module 126 can establish, at the request of an application running on client computer 102, a communication link to network 114. Such a communication link can be established in any of a variety of conventional manners, such as a “dial-up connection” using a conventional modem and telephone line, through a network proxy, etc. Once established, network module 126 manages the communication link according to any of a wide variety of conventional communications protocols, allowing different applications running on client 102 to communicate with servers 104 and 106, as well as any other devices or computers coupled to network 114.

Registration wizard 120 collects registration information, including demographic and/or other user- or client computer-related information from a user of client 102. This collection occurs, for example, when the client computer is first set up or the software is first installed. Registration wizard 120 collects this registration information by prompting the user for inputs via a user interface (UI). This prompting can be done in any of a variety of conventional manners, such as through menu options, radio buttons, or other data-entry fields of a graphical user interface, through audio questions and user-responses via a microphone, etc.

1 Registration wizard 120 may also interrogate, either with or without the user's
2 knowledge, the operating system 116 or other modules to ascertain additional
3 computer-related information (e.g., processor type, amount of memory, etc.).

4 Typically, both the manufacturer of client computer 102 and the
5 manufacturer of operating system 116 want to collect registration information.
6 Furthermore, manufacturers of other applications 124 as well as other peripheral
7 components (not shown), such as printers or scanners, may also want to collect
8 registration information. As used herein, each of the different components
9 (whether hardware or software) of client computer 102 (including client computer
10 102 itself) for which registration information is to be collected is referred to as a
11 "registering component".

12 Registration databases 108 – 112 correspond to one or more manufacturers.
13 For example, registration database 108 may correspond to the manufacturer of the
14 client computer 102, while registration database 110 and/or registration database
15 112 may correspond to the manufacturer of the operating system 116. One of the
16 posting modules 122 uploads a portion of the registration information
17 corresponding to the registration requests of a manufacturer to the registration
18 database 108 – 112 that corresponds to that manufacturer. The registration
19 databases 108 – 112 can be maintained by the manufacturers, or alternatively by a
20 third party that temporarily stores the registration information until subsequently
21 retrieved by the manufacturer.

22 According to one aspect of the invention, registration wizard 120 is
23 programmed with the registration requests (e.g., user questions, operating system
24 interrogation requests, etc.) of both the manufacturer of client computer 102 and
25 the manufacturer of operating system 116. By programming registration wizard

120 to collect registration information for both manufacturers, duplicate questions can be eliminated. For example, registration wizard 120 need only request a user's name and address once even though that information may be subsequently provided to both manufacturers.

Alternatively, multiple registration wizards could be used to provide a unified interface that did not duplicate questions for the user. For example, a first registration wizard could be programmed to collect part (e.g., half) of the registration information, while a second registration wizard could be programmed to collect the remaining part (e.g., the other half) of the registration information. Both wizards could have a similar look and feel so that they would appear integrated to the user even though they are two separate programs.

Registration wizard 120 can be programmed with the registration requests in any of a wide variety of conventional manners. According to one implementation, the manufacturer of registration wizard 120 manually adds all of the registration requests to registration wizard 120. Any duplicate questions are removed as part of this manual programming process.

According to another implementation, registration wizard 120 accesses one or more registration request documents 128 to identify which registration information to collect. A “core document” including a core set of registration requests is included in documents 128. The core document is provided by the manufacturer of registration wizard 120 (or alternatively one of the registering components) and includes common information generally requested, such as user name, address, phone number, etc. Any information that the manufacturer wants to collect that is not already collected as part of the core set of registration requests can be collected by adding to the core document. Alternatively, additional

1 The registration information uploaded to each of the registration servers is
2 dependent on the registration requests provided by each of the manufacturers or
3 third party. The portion of the collected registration information that corresponds
4 to the registration requests provided by a manufacturer is uploaded to the
5 registration server corresponding to that manufacturer or third party. The portions
6 of the registration information uploaded for different manufacturers or third party
7 may "overlap" or share some common information (e.g., both may include the
8 user's name and address), or alternatively the portions may be identical.

9 Using the single post method, a separate modem call is made to upload or
10 "post" the registration information for each of the manufacturers. Upon collecting
11 the registration information, registration wizard 120 initiates execution of a
12 different posting module 122 for each of the manufacturers. In response, each of
13 the posting modules 122 establishes a communication link (e.g., a dial-up
14 connection) to connect to a predetermined registration server 104 or 106 by
15 invoking network module 126. Upon establishing the connection, the posting
16 module 122 posts the registration information for that manufacturer to the
17 registration database via the corresponding registration server (e.g., to registration
18 database 112 via registration server 106).

19 Upon completing the posting, posting module 122 terminates, at which
20 point registration wizard 120 calls another of the posting modules 122. The newly
21 called posting module 122 then establishes a communication link to connect to the
22 appropriate one of the registration servers by invoking network module 126. The
23 posting module then proceeds to post the registration information for the
24 corresponding manufacturer to the appropriate one of the registration databases via
25

a corresponding registration server. This process continues until the registration information is posted to each of the appropriate servers.

In the illustrated example of Fig. 1, the posting modules 122 correspond on a one-to-one basis with the registration databases 108 – 112. The posting modules 122 are manufacturer-specific, as are the registration databases 108 – 112. Alternatively, multiple posting modules may be combined into a single posting module, or multiple registration databases may correspond to a particular manufacturer and a particular one of modules 122.

Using the multiple post method, a single modem call is made to upload or post the registration information for multiple manufacturers. Upon collecting the registration information, registration wizard 120 establishes a communication link by invoking network module 126. Once the communication link is established, registration wizard 120 calls a first of the posting modules 122. In response, the called posting module 122 establishes a connection (e.g., using HTTP) via the network 114 to the appropriate one of servers 104 and 106. The registration information is uploaded and stored, by the server, in a registration database coupled to the server (e.g., registration database 110 coupled to server 104). The module 122 also provides an identifier of the manufacturer of server 104, which is used by server 104 to determine which of databases 108 or 110 the registration information is to be stored in. After uploading or posting of the registration information is complete, the posting module 122 terminates and registration wizard 120 calls another of the posting modules 122. The newly called posting module 122 establishes an HTTP connection, via the network 114, to the appropriate one of servers 104 and 106 and uploads the registration information for the corresponding manufacturer to the server. This process continues until the

1 registration information is posted to each of the appropriate servers, at which point
2 registration wizard 120 terminates execution and the communication link to
3 network 114 is closed.

4 Using the serial post method, a single modem call is made to upload or post
5 the registration information for multiple manufacturers or third parties. Upon
6 collecting the registration information, registration wizard 120 establishes a
7 communication link by invoking network module 126. Once the communication
8 link is established, registration wizard 120 calls a first of the posting modules 122.
9 In response, the called posting module 122 establishes a connection (e.g., using
10 HTTP) via the network 114 to the appropriate one of servers 104 and 106. The
11 registration information is uploaded and stored, by the server, in a registration
12 database coupled to the server (e.g., registration database 110 coupled to server
13 104). The module 122 also provides an identifier of the manufacturer of server
14 104, which is used by server 104 to determine which of databases 108 or 110 the
15 registration information is to be stored in. After uploading or posting of the
16 registration information is complete, the posting module 122 terminates and
17 registration server 104 or 106 posts to another registration server 104 or 106
18 (additionally, registration wizard 120 may call one or more additional posting
19 modules 122 to upload registration information to other servers 104 or 106 prior to
20 terminating the communication link). The server 104 or 106 establishes an HTTP
21 connection, via the network 114, to the appropriate one of servers 104 and 106 and
22 uploads the registration information for the corresponding manufacturer or third
23 party to that server. This process continues until the registration information is
24 posted to each of the appropriate servers, at which point registration server 104 or
25 106 terminates its registering and the communication link between the server 104

1 or 106 and network 114 is closed. Thus, using the serial post method, some of the
2 registration information is transferred from server to server rather than directly
3 from client to multiple servers.

4 Alternatively, a posting module 122 may establish a connection to a
5 particular registration database of a server, such as registration database 110. This
6 connection comprises, for example, an HTTP connection between client 102 and
7 server 104 with an identifier of registration database 110 being provided to server
8 104 by client 102.

9 Additionally, a single client to server connection may be made that allows
10 uploading of the registration information for multiple manufacturers. In the
11 illustrated example, server 104 is coupled to registration databases 108 and 110.
12 According to one implementation, registration database 108 stores the uploaded
13 registration information corresponding to one of the manufacturers while
14 registration database 110 stores the uploaded registration information
15 corresponding to another of the manufacturers. Therefore, a single modem call
16 and single client to server connection can be used to upload registration
17 information for multiple manufacturers.

18 Thus, using either the multiple or serial post methods only one modem call
19 need be made in order to establish a communication link to network 114. In the
20 multiple post method, once that communication link is established any number of
21 additional client to server (or client to registration database) connections can be
22 established via the network 114 without having to make another modem call.
23 These client to server connections can be made using any of a variety of different
24 communication protocols, such as HTTP, secure HTTP (HTTPS), etc. In the serial
25 post method, once the communication link to network 114 is established and the

1 registration information is uploaded to a first server, any number of additional
2 servers can receive the registration information (or portions thereof) from the first
3 server (or another server that received the registration information, either directly
4 or indirectly, from the first server). This communication between servers can be
5 made using any of a variety of different communication protocols, such as HTTP
6 or HTTPS.

7 It should also be noted that, although described above with reference to the
8 unified interface provided by registration wizard 120, the multiple and serial post
9 methods can also be used when there are multiple registration wizards 120. In
10 such situations, network module 126 maintains the network communication link
11 while different registration wizards 120 are executing and calling different posting
12 modules 122. By maintaining the network communication link, uploading of
13 portions of the registration information collected by different registration wizards
14 120 can be performed even though only one modem call is used to establish the
15 communication link.

16 The single post, multiple post, and serial post methods are described with
17 reference to establishing a network communication link via a modem call.
18 Alternatively, other conventional connection methodologies may be used with the
19 invention rather than modem calls, such as a network communication link through
20 a proxy server.

21 22 **Exemplary Computer System**

23 In the discussion herein, the invention is described in the general context of
24 computer-executable instructions, such as program modules, being executed by
25 one or more conventional personal computers. Generally, program modules

1 include routines, programs, objects, components, data structures, etc. that perform
2 particular tasks or implement particular abstract data types. Moreover, those
3 skilled in the art will appreciate that the invention may be practiced with other
4 computer system configurations, including hand-held devices, multiprocessor
5 systems, microprocessor-based or programmable consumer electronics, network
6 PCs, minicomputers, mainframe computers, and the like. In a distributed
7 computer environment, program modules may be located in both local and remote
8 memory storage devices.

9 Fig. 2 shows a general example of a computer 130 that can be used as a
10 server or client in accordance with the invention. Computer 130 is shown as an
11 example of a computer that can perform the functions of a client computer 102 or
12 a server 104 or 106 of Fig. 1.

13 Computer 130 includes one or more processors or processing units 132, a
14 system memory 134, and a bus 136 that couples various system components
15 including the system memory 134 to processors 132.

16 The bus 136 represents one or more of any of several types of bus
17 structures, including a memory bus or memory controller, a peripheral bus, an
18 accelerated graphics port, and a processor or local bus using any of a variety of
19 bus architectures. The system memory includes read only memory (ROM) 138
20 and random access memory (RAM) 140. A basic input/output system (BIOS) 142,
21 containing the basic routines that help to transfer information between elements
22 within computer 130, such as during start-up, is stored in ROM 138. Computer
23 130 further includes a hard disk drive 144 for reading from and writing to a hard
24 disk, not shown, a magnetic disk drive 146 for reading from and writing to a
25 removable magnetic disk 148, and an optical disk drive 150 for reading from or

1 writing to a removable optical disk 152 such as a CD ROM or other optical media.
 2 The hard disk drive 144, magnetic disk drive 146, and optical disk drive 150 are
 3 connected to the bus 136 by an SCSI interface 154 or some other appropriate
 4 interface. The drives and their associated computer-readable media provide
 5 nonvolatile storage of computer readable instructions, data structures, program
 6 modules and other data for computer 130. Although the exemplary environment
 7 described herein employs a hard disk, a removable magnetic disk 148 and a
 8 removable optical disk 152, it should be appreciated by those skilled in the art that
 9 other types of computer readable media which can store data that is accessible by a
 10 computer, such as magnetic cassettes, flash memory cards, digital video disks,
 11 random access memories (RAMs) read only memories (ROM), and the like, may
 12 also be used in the exemplary operating environment.

13 A number of program modules may be stored on the hard disk, magnetic
 14 disk 148, optical disk 152, ROM 138, or RAM 140, including an operating system
 15 158, one or more application programs 160, other program modules 162, and
 16 program data 164. A user may enter commands and information into computer
 17 130 through input devices such as keyboard 166 and pointing device 168. Other
 18 input devices (not shown) may include a microphone, joystick, game pad, satellite
 19 dish, scanner, or the like. These and other input devices are connected to the
 20 processing unit 132 through an interface 170 that is coupled to the bus 136. A
 21 monitor 172 or other type of display device is also connected to the bus 136 via an
 22 interface, such as a video adapter 174. In addition to the monitor, personal
 23 computers typically include other peripheral output devices (not shown) such as
 24 speakers and printers.

Computer 130 operates in a networked environment using logical connections to one or more remote computers, such as a remote computer 176. The remote computer 176 may be another personal computer, a server, a router, a network PC, a peer device or other common network node, and typically includes many or all of the elements described above relative to computer 130, although only a memory storage device 178 has been illustrated in Fig. 2. The logical connections depicted in Fig. 2 include a local area network (LAN) 180 and a wide area network (WAN) 182. Such networking environments are commonplace in offices, enterprise-wide computer networks, intranets, and the Internet. In the described embodiment of the invention, remote computer 176 executes an Internet Web browser program such as the "Internet Explorer" Web browser manufactured and distributed by Microsoft Corporation of Redmond, Washington.

When used in a LAN networking environment, computer 130 is connected to the local network 180 through a network interface or adapter 184. When used in a WAN networking environment, computer 130 typically includes a modem 186 or other means for establishing communications over the wide area network 182, such as the Internet. The modem 186, which may be internal or external, is connected to the bus 136 via a serial port interface 156. In a networked environment, program modules depicted relative to the personal computer 130, or portions thereof, may be stored in the remote memory storage device. It will be appreciated that the network connections shown are exemplary and other means of establishing a communications link between the computers may be used.

Generally, the data processors of computer 130 are programmed by means of instructions stored at different times in the various computer-readable storage media of the computer. Programs and operating systems are typically distributed,

for example, on floppy disks or CD-ROMs. From there, they are installed or loaded into the secondary memory of a computer. At execution, they are loaded at least partially into the computer's primary electronic memory. The invention described herein includes these and other various types of computer-readable storage media when such media contain instructions or programs for implementing the steps described below in conjunction with a microprocessor or other data processor. The invention also includes the computer itself when programmed according to the methods and techniques described below. Furthermore, certain sub-components of the computer may be programmed to perform the functions and steps described below. The invention includes such sub-components when they are programmed as described. In addition, the invention described herein includes data structures, described below, as embodied on various types of memory media.

For purposes of illustration, programs and other executable program components such as the operating system are illustrated herein as discrete blocks, although it is recognized that such programs and components reside at various times in different storage components of the computer, and are executed by the data processor(s) of the computer.

Operation

Fig. 3 is a flowchart illustrating an exemplary process for the unified collection of registration information in accordance with one implementation of the invention. The process of Fig. 3 is implemented by client computer 102 of Fig. 1, and may be performed in software. Fig. 3 is described with additional reference to components in Fig. 1.

Registration wizard 120 generates a single user interface corresponding to multiple registering components (step 202). Registration wizard 120 then collects registration information without duplicating questions to the user (step 204). It should be noted that duplicate queries to interrogate the operating system may optionally be avoided in step 204 as well. The collected registration information is then uploaded to the appropriate registration databases (step 206). The uploading of the registration information can be accomplished using the single post, multiple post, or serial post methods discussed above.

Fig. 4 is a flowchart illustrating an exemplary process for posting of collected registration information in accordance with one implementation of the invention. The process of Fig. 4 is implemented by client computer 102 of Fig. 1, and may be performed in software. Fig. 4 is described with additional reference to components in Fig. 1.

The registration information is initially collected by registration wizard 120 (step 222). Network module 126 then establishes a network communication link to the network 114 (step 224). Once the communication link is established, registration wizard 120 invokes one of the posting modules 122, which in turn establishes a connection to one of the servers or databases via the communication link (step 226). The posting module 122 then transfers a portion of the registration information to the server or registration database via the connection (step 228). Registration wizard 120 then checks whether there are additional transfers to be made (step 230). Registration wizard 120 continues to invoke posting modules 122 so long as there are additional transfers to be made (steps 228 and 230). When the appropriate registration information for each of the manufacturers has

1 been transferred to a corresponding server or registration database, the registration
2 process ends (step 230).

3 4 **Conclusion**

5 The invention provides for the unified collection and uploading of user
6 registration information. According to one aspect of the invention, a single user
7 interface is provided to collect the registration information for multiple different
8 manufacturers or third parties. The user is provided with a unified interface that
9 advantageously avoids asking the user duplicate questions. Additionally,
10 according to one aspect of the invention, a multiple post method is used to upload
11 the registration information to the manufacturers' registration databases. The
12 multiple post method advantageously uses a single communication link to the
13 network to upload the registration information to all of the registration databases,
14 regardless of the number of registration databases.

15 Although the invention has been described in language specific to structural
16 features and/or methodological steps, it is to be understood that the invention
17 defined in the appended claims is not necessarily limited to the specific features or
18 steps described. Rather, the specific features and steps are disclosed as preferred
19 forms of implementing the claimed invention.

1 **CLAIMS**

2
3 1. One or more computer-readable media having stored thereon a
4 computer program that, when executed by one or more processors, causes the one
5 or more processors to perform functions including:

6 collecting, at a client computer, registration information using one or more
7 registration wizards;

8 establishing a communication link between the client computer and a
9 network;

10 establishing a first connection, via the communication link, to a first
11 registration server of a plurality of registration servers;

12 communicating at least a first portion of the registration information to the
13 first registration server via the first connection;

14 establishing a second connection, via the communication link, to a second
15 registration server of the plurality of registration servers; and

16 communicating at least a second portion of the registration information to
17 the second registration server via the second connection.

18
19 2. One or more computer-readable media as recited in claim 1, wherein
20 the program further causes the one or more processors to perform functions
21 including:

22 establishing additional connections to additional registration servers of the
23 plurality of registration servers via the communication link; and

24 communicating additional portions of the registration information to the
25 additional registration servers.

1
2 3. One or more computer-readable media as recited in claim 1, wherein
3 the first portion and the second portion share at least some common information.
4

5 4. One or more computer-readable media as recited in claim 1, wherein
6 the first portion and the second portion are identical.
7

8 5. One or more computer-readable media as recited in claim 1, wherein
9 the registration information includes one or more of user demographic information
10 and client computer information.
11

12 6. One or more computer-readable media as recited in claim 1, wherein
13 the one or more registration wizards correspond to one or more software
14 applications or hardware components.
15

16 7. One or more computer-readable media as recited in claim 1, wherein
17 the establishing the first connection comprises establishing a first hypertext
18 transfer protocol (HTTP) connection, and wherein the establishing the second
19 connection comprises establishing a second hypertext transfer protocol (HTTP)
20 connection.
21

22 8. A method comprising:
23 collecting, at a client computer, registration information using a registration
24 wizard;
25

1 establishing a communication link between the client computer and a
2 network;

3 establishing a plurality of connections, via the communication link,
4 between the client computer and a plurality of registration databases; and

5 communicating, for each of the plurality of connections, at least a portion
6 of the registration information to one of the plurality of registration databases.

7
8 **9.** A method as recited in claim 8, wherein the communicating
9 comprises communicating, for each of the plurality of connections, a different
10 portion of the registration information to the one of the plurality of registration
11 databases.

12
13 **10.** A method as recited in claim 9, wherein the different portions share
14 at least some common information.

15
16 **11.** A method as recited in claim 8, wherein the registration information
17 includes one or more of user demographic information and client computer
18 information.

19
20 **12.** A method as recited in claim 8, wherein the collecting comprises
21 collecting the registration information for a plurality of software applications and
22 hardware components.

1 **13.** One or more computer-readable memories containing a computer
2 program that is executable by a processor to perform the method recited in claim
3 8.

4
5 **14.** A method comprising:
6 collecting, at a client computer, registration information for a plurality of
7 registering components using a single registration wizard;
8 establishing a plurality of connections between the client computer and a
9 plurality of registration databases corresponding to the plurality of registering
10 components; and
11 transferring at least a portion of the registration information to each of the
12 plurality of registration databases via the plurality of connections.

13
14 **15.** A method as recited in claim 14, wherein the plurality of registering
15 components includes a software component and a hardware component.

16
17 **16.** A method as recited in claim 15, wherein the hardware component
18 comprises the client computer.

19
20 **17.** A method as recited in claim 14, wherein the plurality of registering
21 components correspond on a one to one basis with the plurality of registration
22 databases.

1 **18.** A method as recited in claim 14, wherein the establishing a plurality
2 of connections comprises:

3 establishing a communication link between the client computer and a
4 network; and

5 subsequently establishing connections between the client computer and
6 each of the plurality of registration databases via the communication link.

7
8 **19.** A method as recited in claim 14, wherein the establishing a plurality
9 of connections comprises:

10 establishing, using a first dial-up number, a first communication link to a
11 first of the plurality of registration databases; and

12 upon terminating the first communication link, establishing, using a second
13 dial-up number, a second communication link to a second of the plurality of
14 registration databases.

15
16 **20.** A method as recited in claim 14, wherein the transferring comprises
17 transferring different portions of the registration information to different ones of
18 the plurality of registration databases.

19
20 **21.** A method as recited in claim 14, wherein the registration
21 information includes one or more of user demographic information and client
22 computer information.

1 **22.** One or more computer-readable memories containing a computer
2 program that is executable by a processor to perform the method recited in claim
3 14.

4
5 **23.** A system comprising:
6 a registration wizard to collect registration information for a plurality of
7 manufacturers; and
8 one or more posting modules, coupled to the registration wizard, to,
9 establish a plurality of connections between the client computer and
10 a plurality of registration databases corresponding to the plurality of
11 manufacturers, and
12 transfer at least a portion of the registration information to each of
13 the plurality of registration databases via the plurality of connections.
14

15 **24.** A system as recited in claim 23, wherein the plurality of
16 manufacturers include one or more of software application designers, hardware
17 component manufacturers, and the system manufacturer.
18

19 **25.** A system as recited in claim 23, wherein the plurality of
20 manufacturers correspond on a one to one basis with the plurality of registration
21 databases.
22
23
24
25

1 **26.** A system as recited in claim 23, wherein the one or more posting
2 modules are further to transfer different portions of the registration information to
3 different ones of the plurality of registration databases.

4
5 **27.** A system as recited in claim 23, wherein the registration information
6 includes one or more of user demographic information and client computer
7 information.

8
9 **28.** A system comprising:
10 a plurality of server computers coupled to a network, each being coupled to
11 at least one of a plurality of registration databases to store registration information
12 received by the server computer; and

13 a client computer, coupled to the network, to collect registration
14 information for a plurality of manufacturers using a single user interface and to
15 upload portions of the registration information to registration databases of the
16 plurality of registration databases via a single communication link.

17
18 **29.** An apparatus comprising:
19 a bus;
20 a processor coupled to the bus;
21 a network connection device coupled to the bus; and
22 a memory, coupled to the bus, to store a plurality of instructions that are
23 executed by the processor, wherein the plurality of instructions, when executed,
24 cause the processor to,
25 collect registration information,

1 initiate, using the network connection device, a communication link
2 to a network,

3 establish, via the communication link, a plurality of connections
4 between the apparatus and a plurality of registration databases, and

5 communicate, for each of the plurality of connections, at least a
6 portion of the registration information to one of the plurality of registration
7 databases.

8
9 **30.** An apparatus as recited in claim 29, wherein the plurality of
10 instructions that, when executed, cause the processor to collect registration
11 information further cause the processor to collect one or more of user demographic
12 information and client computer information.

1 **ABSTRACT**

2 A client computer collects registration information and uploads the
3 collected information to one or more remote registration databases. The collection
4 and/or uploading of registration information for multiple manufacturers is
5 performed in a unified manner, improving the user-friendliness of the computer.
6 According to one aspect of the invention, a single user interface is used to collect
7 the registration information for all of the manufacturers, preventing the same
8 question from being asked multiple times. According to another aspect of the
9 invention, a multiple posting method is used to upload the registration information
10 to the registration databases. In the multiple posting method, a single network
11 communication link is established between the client computer and a network that
12 the registration databases are coupled to, via which multiple client computer to
13 registration database connections are established.

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Inventorship Feinleib et al.
 Applicant Microsoft Corporation
 Attorney's Docket No. MS1-311US
 Title: System and Method for Unified Registration Information Collection

DECLARATION FOR PATENT APPLICATION

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled "System and Method for Unified Registration Information Collection," the specification of which is attached hereto.

I have reviewed and understand the content of the above-identified specification, including the claims.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, § 1.56(a).

PRIOR FOREIGN APPLICATIONS: no applications for foreign patents or inventor's certificates have been filed prior to the date of execution of this declaration.

Power of Attorney

I appoint the following attorneys to prosecute this application and transact all future business in the Patent and Trademark Office connected with this application:
 Lewis C. Lee, Reg. No. 34,656; Daniel L. Hayes, Reg. No. 34,618; Allan T.

1 Sponseller, Reg. 38,318; Steven R. Sponseller, Reg. No. 39,384; James R.
2 Banowsky, Reg. No. 37,773; Lance R. Sadler, Reg. No. 38,605; Michael A. Proksch,
3 Reg. No. 43,021; Thomas A. Jolly, Reg. No. 39,241; David A. Morasch, Reg. No.
4 42,905; Katie E. Sako, Reg. No. 32,628 and Daniel D. Crouse, Reg. No. 32,022.

5 Send correspondence to: LEE & HAYES, PLLC, 421 W. Riverside Avenue,
6 Suite 500, Spokane, Washington, 99201. Direct telephone calls to: Allan T.
7 Sponseller (509) 324-9256.

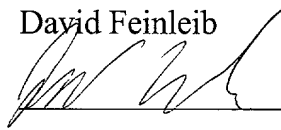

8
9 All statements made herein of my own knowledge are true and that all
10 statements made on information and belief are believed to be true; and further that
11 these statements were made with the knowledge that willful false statements and the
12 like so made are punishable by fine or imprisonment, or both, under Section 1001 of
13 Title 18 of the United States Code and that such willful false statement may
14 jeopardize the validity of the application or any patent issued therefrom.
